Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in the application.

Claim 1 (currently amended): A multiple compression coding method in which an input signal feeds in parallel a plurality of coders each including a succession of functional units with a view to compression coding of said signal by each coder, ~~which~~ wherein the method ~~is~~ ~~characterized in that it includes~~ comprises the following ~~preparatory~~ steps:

  a) identifying the functional units forming each coder and one or more functions implemented by each unit;

  b) marking functions that are common from one coder to another; and

  c) executing said common functions once and for all for at least some of the coders in a common calculation module.

Claim 2 (currently amended): A method according to claim 1, ~~characterized in that~~ wherein said calculation module ~~consists of~~ comprises at least one ~~or more~~ functional ~~units~~ unit of one of the coders.

Claim 3 (currently amended): A method according to claim 2, ~~characterized in that~~ wherein, for each function executed in step c), at least one functional unit is used of a coder selected from said plurality of coders and the functional unit of said coder selected is adapted to deliver partial results to the other coders, for efficient coding by said other coders verifying an optimum criterion between complexity and coding quality.

Claim 4 (currently amended): A method according to claim 3, ~~wherein~~ the coders ~~are~~ being liable to operate at respective different bit rates, ~~characterized in that~~ wherein the selected coder ~~selected~~ is the coder with the lowest bit rate and the results obtained after execution of the function in step c) with parameters specific to the selected coder are adapted to the bit rates of at least some of the other coders by a focused parameter search for at least some of the other modes up to the coder with the highest bit rate.

Claim 5 (currently amended): A method according to claim 3, ~~wherein~~ the coders ~~are~~ <u>being</u> adapted to operate at respective different bit rates, ~~characterized in that~~ <u>wherein</u> the coder selected is the coder with the highest bit rate and the results obtained after execution of the function in step c) with parameters specific to the selected coder are adapted to the bit rates of at least some of the other coders by a focused parameter search for at least some of the other modes up to the coder with the lowest bit rate.

Claim 6 (currently amended): A method according to claim 4 ~~in combination with claim 5,~~ ~~characterized in that,~~ <u>wherein</u> the functional unit of a coder operating at a given bit rate is used as the calculation module for that bit rate and at least some of the parameters specific to that coder are progressively adapted:
  · up to the coder with the highest bit rate by focused searching; and
  · up to the coder with the lowest bit rate by focused searching.

Claim 7 (currently amended): A method according to claim 1, wherein the functional units of the various coders are arranged in a trellis with a plurality of possible paths in the trellis, ~~characterized in that~~ <u>wherein</u> each path in the trellis is defined by a combination of operating modes of the functional units and each functional unit feeds a plurality of possible variants of the next functional unit.

Claim 8 (currently amended): A method according to claim 7, ~~characterized in that~~ <u>wherein</u> a partial selection module is provided after each coding step conducted by one or more functional units capable of selecting the results supplied by one or more of those functional units for subsequent coding steps.

Claim 9 (currently amended): A method according to claim 7, ~~wherein~~ the functional units ~~are~~ <u>being</u> liable to operate at respective different bit rates using respective parameters specific to said bit rates, ~~characterized in that~~ <u>wherein</u>, for a given functional unit, the path selected in the trellis is that passing through the lowest bit rate functional unit and the results obtained from said lowest bit rate functional unit are adapted to the bit rates of at least some of the other functional

units by a focused parameter search for at least some of the other functional units up to the highest bit rate functional unit.

Claim 10 (currently amended): A method according to claim 7, ~~wherein~~ the functional units ~~are~~ being liable to operate at respective different bit rates using respective parameters specific to said bit rates ~~and characterized in that~~, wherein, for a given functional unit, the path selected in the trellis is that passing through the highest bit rate functional unit and the results obtained from said highest bit rate functional unit are adapted to the bit rates of at least some of the other functional units by a focused parameter search for at least some of the other functional units up to the lowest bit rate functional unit.

Claim 11 (currently amended): A method according to claim 9 ~~in combination with claim 10, characterized in that~~, wherein, for a given bit rate associated with the parameters of a functional unit of a coder, the functional unit operating at said given bit rate is used as the calculation module and at least some of the parameters specific to that functional unit are progressively adapted:

· up to the functional unit capable of operating at the lowest bit rate by focused searching; and

· up to the functional unit capable of operating at the highest bit rate by focused searching.

Claim 12 (currently amended): A method according to claim 1, ~~characterized in that~~ wherein said calculation module is independent of said coders and is adapted to redistribute results obtained in step c) to all the coders.

Claim 13 (currently amended): A method according to claim 12 ~~in combination with claim 2, characterized in that~~, wherein the independent module and the functional unit or units of at least one of the coders are adapted to exchange results obtained in step c) with each other and the calculation module is adapted to effect adaptation transcoding between functional units of different coders.

Claim 14 (currently amended): A method according to ~~either claim 12 or 13, characterized in that~~ claim 12, wherein the independent module includes an at least partial coding functional unit and an adaptation transcoding functional unit.

Claim 15 (currently amended): A method according to ~~any one of the preceding claims~~ claim 1, wherein the coders in parallel are adapted to operate multimode coding and ~~characterized in that~~ an *a posteriori* selection module is provided capable of selecting one of the coders.

Claim 16 (currently amended): A method according to claim 15, ~~characterized in that~~ wherein a partial selection module is provided that is independent of the coders and able to select one or more coders after each coding step conducted by one or more functional units.

Claim 17 (currently amended): A method according to ~~any one of the preceding claims~~ claim 1, wherein the coders are of the transform type and ~~characterized in that~~ the calculation module includes a bit assignment functional unit shared between all the coders, each bit assignment effected for one coder being followed by an adaptation to that coder, in particular as a function of its bit rate.

Claim 18 (currently amended): A method according to claim 17, ~~characterized in that~~ wherein the method further includes a quantization step the results whereof are supplied to all the coders.

Claim 19 (currently amended): A method according to claim 18, ~~characterized in that~~ wherein it further includes steps common to all the coders including:
- a time-frequency ~~(MDCT)~~ transform;
- detection of voicing in the input signal;
- detection of tonality;
- determination of a masking curve; and
- spectral envelope coding.

Claim 20 (currently amended): A method according to claim 17, wherein the coders effect sub-band ~~(MPEG-1) coding, characterized in that~~ and the method further includes steps common to all the coders including:

> · application of a bank of analysis filters;
>
> · determination of scaling factors;
>
> · spectral transform ~~(FFT)~~ calculation; and
>
> · determination of masking thresholds in accordance with a psycho-acoustic model.

Claim 21 (currently amended): A method according to ~~any one of claims 1 to 16~~ claim 1, wherein the coders are of the analysis by synthesis ~~(CELP)~~ type and ~~characterized in that~~ the method includes steps common to all the coders including:

> · preprocessing;
>
> · linear prediction coefficient analysis;
>
> · weighted input signal calculation; and
>
> · quantization for at least some of the parameters.

Claim 22 (currently amended): A method according to claim 21 ~~in combination with claim 16, characterized in that,~~ wherein the partial selection module is used after a split vector quantization step for short-term ~~(LPC)~~ parameters.

Claim 23 (currently amended): A method according to claim 21 ~~in combination with claim 16, characterized in that,~~ wherein the partial selection module is used after a shared open loop long-term parameter ~~(LTP)~~ search step.

Claim 24 (currently amended): A software product adapted to be stored in a memory of a processor unit, in particular of a computer or a mobile terminal, or in a removable memory medium adapted to cooperate with a reader of the processor unit,
~~characterized in that~~ wherein it includes instructions for implementing preparatory steps of a ~~the~~ transcoding method ~~according to any one of the preceding claims~~ in which an input signal fees in parallel a plurality of coders each including a succession of functional units with a view to compression coding of said signal by each coder,

said preparatory steps including:

a) identifying the functional units forming each coder and one or more functions implemented by each unit;

b) marking functions that are common from one coder to another; and

c) executing said common functions once and for all for at least some of the coders in a common calculation module.

Claim 25 (currently amended): A system for assisting multiple compression coding in which an input signal feeds in parallel a plurality of coders each including a succession of functional units, for the purposes of compression coding of said signal by each coder, ~~characterized in that~~ wherein it includes a memory adapted to store instructions of a software product ~~according to claim 24~~ for implementing preparatory steps of a transcoding method in which an input signal feeds in parallel a plurality of coders each including a succession of functional units with a view to compression coding of said signal by each coder,
said preparatory steps including:

a) identifying the functional units forming each coder and one or more functions implemented by each unit;

b) marking functions that are common from one coder to another; and

c) executing said common functions once and for all for at least some of the coders in a common calculation module.

Claim 26 (currently amended): A device according to claim 25, ~~characterized in that~~ wherein it further includes ~~an~~ said independent calculation module ~~(MI)~~ for implementing ~~the method according to any one of claims 12 to 16, 22 and 23~~ said preparatory steps.
